

EMPLOYEE GUIDELINE

Using WhatsApp Business Without Triggering Avoidable Bans

A practical, low-stress guide for PERSEVEX employees to onboard numbers gradually, keep communication natural, and reduce restriction risk.

Core idea: use each number like a real business communication channel before scaling any customer outreach.

01 - The Problem

Why WhatsApp numbers get banned

Restrictions usually happen when a new or low-trust number suddenly behaves like a broadcast tool. The account may look empty, fast, repetitive, link-heavy, or unwanted.

New number, high activity

Sending many messages before the account has normal usage history.

One-way communication

Many outbound messages with few replies can resemble spam.

Repeated copy-paste

Identical text, links, and fast bursts increase restriction signals.

Important reality: no SOP can guarantee that a number will never be restricted. The goal is to remove avoidable risk and make every account behave like a legitimate support channel.

02 - First 3 Days

Warm up the account naturally

Do not launch campaigns from a fresh number. Build trust signals first: a complete profile, real replies, and calm pacing.

Complete the profile

A blank business profile looks new and less trustworthy.

Get real replies

Two-way conversations are healthier than one-way outbound messaging.

Move gradually

Small batches with pauses are safer than sudden high-volume bursts.

Send like support, not spam

The safest messages feel expected, specific, and conversational. The first touch should not look like a mass promotion.

Do

Personalize greetings, reply to questions, share links only when useful, vary wording naturally.

Avoid

Mass customer blasts, identical forwarded text, link-first messages, adding many unknown contacts.

Good flow

Customer asks -> employee replies -> short conversation -> relevant link or next step.

Bad flow

New number -> copied offer -> link -> same message to everyone.

Message variation examples

Use different openings while keeping the same intent: 'Hi John, sharing the course details you requested.' / 'Thanks for reaching out, John. Here are the details.' / 'Great speaking with you, John. Sending the information below.'

04 - Mitigation Strategy

What employees should do from now on

Every new number should pass a small readiness check before any customer campaign or higher-volume communication.

1. Prepare

Install WhatsApp Business, complete profile, set greeting, verify SIM and details.

2. Humanize

Exchange messages with 5-10 known contacts and receive real replies.

3. Scale slowly

Start with individual customer support, then increase only when engagement stays healthy.

SIM card change rule

Keep using the working account

When SIM cards change, avoid creating a new WhatsApp account if the previous WhatsApp is still working. Continue using it as long as it remains active.

Do not lose the old SIM

Keep the previous SIM card safely with the team. It may be required later for OTP verification or relogging into the old WhatsApp account.

If using WhatsApp Business Platform/API

- Verify the business and number before campaigns.
- Use approved templates where required.
- Start with smaller volumes and increase gradually.
- Monitor delivery rate, quality rating, and user feedback.
- Personalize once users respond inside the customer service window.

If an account is restricted

- Stop bulk or automated messaging immediately.
- Complete any WhatsApp verification or review steps.
- Continue only genuine one-to-one conversations where appropriate.
- Review recent activity before resuming higher-volume messaging.
- Do not rapidly cycle new replacement numbers to bypass restrictions.

Before using a new number

Use this as a quick sign-off before handing a number to the sales, support, or outreach team.

Account readiness	Messaging behavior
☐ Profile photo, business name, category, website/email, and hours are complete.	☐ No mass customer messaging happened on Day 1.
☐ The account has exchanged messages with 5-10 known people.	☐ Outbound messages are personalized, not identical copy-paste.
☐ There are genuine incoming replies.	☐ Links are shared only after context or customer interest.
SIM and access control	Risk response
☐ If an old WhatsApp is still working after a SIM change, keep using it.	☐ Activity is spread through the day with natural pauses.
☐ The previous SIM card is stored safely for future OTP or relogin needs.	☐ The employee knows what to do if a warning or restriction appears.

Key principle

Do not try to 'look human' artificially. Use WhatsApp the way legitimate businesses do: clear identity, expected messages, real replies, relevant links, and gradual scaling.
